

How to set up your Regulator and O2Ready Tank

1. To connect, simply screw the bottom part of the regulator onto the threaded top of the tank. [FIGURE 1]
2. Once the regulator is attached, make sure the regulator is set to ZERO by adjusting the black dial on top of the regulator (if needed). [FIGURE 2]
3. Turn the valve counter-clockwise to release the oxygen. [FIGURE 3]
4. You can now set the oxygen to your desired flow rate by adjusting the black dial on the regulator. [FIGURE 2]
5. When you are finished, turn off the oxygen flow by turning the valve clockwise. This will ensure oxygen remains in the tank. **Failure to turn off the tank after use may result in loss of oxygen.** You do not need to release the pressure from the regulator when you are done using it.

Note: If the pressure indicator arrow on the regulator falls to just above zero when the oxygen is turned on, it is time to replace the tank. [FIGURE 4]

Warnings

1. Do not use with oil, grease or any other flammable material.
2. Keep out of reach of children.
3. Do not smoke in an area where oxygen is in use.
